Summary

My research interests center on computer vision, machine learning and medical imaging. Recent research include (1) Physics-conditioned deep learning PDE algorithms for transport time series (e.g., fluid flow and mass diffusion). Applications include flow simulation, CT/MR perfusion image analysis, lesion detection and localization. (2) 3D point cloud registration with optimal transport. Applications include lung registration, meshed human modeling. (3) Image animation and motion transfer.

Feb 2019 – Present

- Proposed a general learning framework for constraint-free representation learning of physics fields from mass transport time series. **[CVPR'21 Oral]**
- Built a PyTorch advection-diffusion PDE solver toolkit (in 1/2/3D) with various boundary conditions, which can be used for both numerical solutions and data simulation.
- Created a 3D brain advection-diffusion simulator, which integrates (1) brain vessel segmentation, blood flow estimation; (2) diffusion tensor estimation; (3) advection-diffusion transport simulation.
- Proposed a data-assimilation approach (PIANO) which estimates the divergence-free velocity and isotropic diffusion fields of the contrast agent in perfusion imaging via variable-coefficient advection-diffusion PDEs. **[MICCAI'20 Oral, IEEE TMI]**
